

ComparativeMarkerSelection Documentation

Module name: ComparativeMarkerSelection

Description: Compare different approaches to marker selection

Author: Joshua Gould, Gad Getz, Stefano Monti (Broad Institute) gp-

help@broad.mit.edu

Date: January 31, 2005

Release: 1.0

The ComparativeMarkerSelection module includes several approaches to determine the features that are most closely correlated with a class template and the significance of that correlation. The module outputs a file containing the following columns:

- 1. **Rank** The rank of the feature within the dataset based on the value of the test statistic. If a two-sided p value is computed, the rank is with respect to the absolute value of the statistic.
- 2. **Feature** The feature name.
- 3. **Score** The value of the test statistic.
- 4. *Feature P* The feature-specific p value based on permutation testing.
- 5. **FPR** (False Positive Rate) The expected proportion of null hypotheses/features having a score better than or equal to the observed one. This measure is not feature-specific, since it is computed by counting the proportion of features having a permuted score better than or equal to the given feature's observed score.
- 6. **FWER** (Family Wise Error Rate) the probability of at least one null hypothesis/feature having a score better than or equal to the observed one. This measure is not feature-specific (see comment about FPR in [5]).
- 7. **Rank P** The rank-specific p value measures the probability that a null hypothesis/ feature with the given *rank* (i.e., a hypothesis/feature whose observed score has that rank) will be rejected. This measure is not feature-specific since it is computed by comparing the permuted scores of equally ranked features, which can be different at different permutation iterations.
- 8. **FDR (BH)** An estimate of the false discovery rate by the Benjamini and Hochberg procedure (3). The FDR is the probability of a rejected hypothesis being null.
- 9. **Bonferroni** The value of the Bonferroni correction applied to the feature specific p value.
- 10. **Q Value** An estimate of the FDR using the procedure developed by Storey and Tibshirani (4). See the definition of the FDR in [8].

The results from the ComparativeMarkerSelection algorithm can be viewed with the ComparativeMarkerSelectionViewer.

Parameters:

input.filename The input fileres, .gct, .odf	oices
input inc input inc inco, igot, loui	
cls.filename The class filecls	
test.direction The test to perform (up-regulated for class 0, up-regulated for class 1, two-sided) Class 0, up-regulated for class 1, two-sided)	iss 0;Class 1; 2 led
test.statistic The statistic to use SN	R;T-Test;SNR

(median);T-Test (median);T-Test (min

std)

min.std The minimum standard deviation if test

statistic is T-Test (min std)

number.of.permutatio The number of permutations to perform

ns

complete Whether to perform all possible yes;no

permutations

balanced Whether to perform balanced yes, no

permutations

fix.standard.deviation Whether to adjust the standard deviation,

yes;no

as is done in GeneCluster output.file

The name of the output file

random.seed The seed of the random number

generator

Return Value:

1. An odf file containing the results
